

33818 Product Refinement

At Wix Filters we are dedicated to the ongoing improvement of our product offerings, and are pleased to announce a product refinement that is being made to our 33818.

You may already be familiar with the first generation design of this product. This cap was designed specifically to offer an appearance similar to that of the OES lid.

The new design product makes use of a completely redesigned cap. This integrated cap has been streamlined for improved ease of installation and should be especially helpful on applications that are challenging to service due to space limitations.

Also, the cap now sports a hex-head molded right into its body. This feature really comes in handy when tightening the filter assembly during installation or when removing it from service.

These changes are being made as part of an ongoing product strategy that focuses on innovation and continuing product improvement.
